

### 57. Find the Kth Smallest Sum of a Matrix With Sorted Rows

You are given an  $m \times n$  matrix `mat` that has its rows sorted in non-decreasing order and an integer `k`.

You are allowed to choose exactly one element from each row to form an array.

Return the `k`th smallest array sum among all possible arrays.

**Program:**

```
import heapq

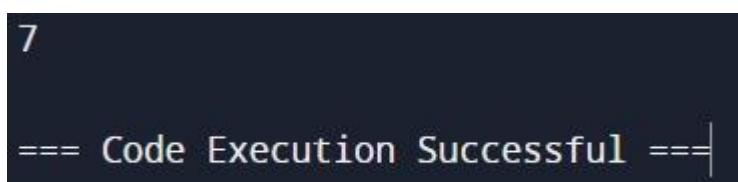

def kthSmallest(mat, k):
    heap = [(sum(row[0] for row in mat), [0] * len(mat))]

    for _ in range(k):
        s, indexes = heapq.heappop(heap)
        for i, idx in enumerate(indexes):
            if idx + 1 < len(mat[i]):
                heapq.heappush(heap, (s - mat[i][idx] + mat[i][idx + 1], indexes[:i] + [idx + 1] + indexes[i+1:]))

    return s

# Example
mat = [[1,3,11],[2,4,6]]
k = 5
print(kthSmallest(mat, k)) # Output: 7
```

**output:**

```
7
=== Code Execution Successful ===
```

**Time complexity:**  $O(nm \log n)$
